Color of WAP browser underline
 - WAP Browser Table border (not in image)
Color of WAP browser table border

All color values must have a value for the phone to accept the file. If not, the phone will report the file as corrupt.

Other Guidelines

Restriction for pictures

The pictures must be valid GIF files or jpeg files. If one file is corrupt the whole theme file will be treated as corrupt.

Use image instead of colors where possible

It is recommended to use an image file in those attributes where the application allows you to do that.

Color restrictions

- All color tags must have a value.
- Following pairs must be separated by an RGB distance of at least 20 after translating to the color depth of the phone.

Text	Background
-------------	-------------------

Highlight_text	Highlight
-----------------------	------------------

More_list_Prompt	More_list_background
-------------------------	-----------------------------

More_list_text	More_list_background
-----------------------	-----------------------------

Prompt	Background
---------------	-------------------

Standby_operatorname	Standby_operatorname_outline
-----------------------------	-------------------------------------

- Following triplets must have at least one color that is separated from the others by RGB distance of at least 20 after translating to the color depth of the phone.

Title
Title_text_shadow
Title_text

More_list_title_text_shadow
More_list_title_text
More_list_title

Desktop_title_outline
Desktop_title
Desktop_background

The reason for these rules is that it must always be possible to navigate to the theme menu and choose another theme.

Known issues

- There may be some inconsistency between the preview and the actual display on the phone, especially when you choose a color instead of an image. Therefore, it is recommended to use an image file in those attributes where the application allows you to do that.
- The Calender and WAP attributes may look different in the phone compared to the preview.
